

GENERAL SCIENCE FACTS

Light travels at 299792 kilometers per second in a vacuum.

It takes about 8 minutes and 20 seconds for sunlight to reach Earth.

Water freezes at 0 degrees Celsius and boils at 100 degrees Celsius at sea level.

The human body is about 60 percent water by weight.

DNA contains the genetic instructions for the development and functioning of all known organisms.

A single DNA molecule can store up to 215 petabytes of data.

The speed of sound is 343 meters per second in air at 20 degrees Celsius.

Atoms are over 99.9 percent empty space.

If you removed all the empty space from atoms, the entire human population would fit in a sugar cube.

Quantum entanglement allows two particles to be instantaneously connected regardless of distance.
